Estimasi Fungsi produksi agregat Indonesia: Pendekatan "Constant elasticity of subtitution"

Deskripsi Lengkap: https://lib.ui.ac.id/detail?id=114203&lokasi=lokal

Abstrak

This study estimates the specification of aggregate production for Indonesia using the constant elasticity of subtitution (CES) production function. The data used in the is an annual data from 1976-2004. By linearized the CES production function, the general last square methods of regression (Wirh the Cochrane-Orcutt Interation Procedure) shows that the elasticity of subtitution between labor and capital is un-perfect which means that the elasticity of subtitution between labor and capital is un-perfect subtitution. This finding is relevant with the cobb-douglas production function as a special case of un-perfect subtitution production function
