

Spesimen tipe cephalopoda dari perairan Indonesia

Deskripsi Lengkap: <https://lib.ui.ac.id/detail?id=130086&lokasi=lokal>

Abstrak

Type specimens have a very high scientific value in studying taxonomy. At the present day, Cephalopods now become one group of mollusc that have been intensively studied. After studying several references, author successfully compiled as much as 29 Cephalopods species that their type localities were from Indonesian water. Type locality can be specified and detail, but sometimes it can be unspecified. Hopefully this compiled information will be useful for other scientists who are interested in studying Cephalopoda from Indonesia.
