

Migration in Indonesian Regions by Education and Employment Factors

Deskripsi Lengkap: <https://lib.ui.ac.id/detail?id=20299950&lokasi=lokal>

Abstrak

In the last two decades, Indonesia has witnessed a surplus growth in the young and educated labor force. A significant proportion of educated people tend to move to other regions in search of jobs. Data from the 1995 Intercensal Population Survey (SUPAS) clearly documented this phenomenon and that many people who migrated belong to younger age groups. The improvements in socioeconomic development across various regions have exerted a tremendous impact on the flow of people as well as gonads across the regional and ethics boundaries within Indonesia. This paper mainly focuses on the region-to-region migration in Indonesia and the influence of major determinants specifically education and employment. For the analysis, logistic regression models are confined to explain the differentials in migration by selected explanatory variables.
