## Abstrak

Son preference's impact on Indian fertility is examined within 14 major stares, utilizing the NFHS surveys of 1992-93 and 1998-99 but with emphasis on the NFHS-2 survey. The l4 states are grouped into two on the basis of the strength of son preference. The analysis indicates that the birth hazards for the gentler composition of surviving children are highest at parity 3 for the majority of the M states. 'The intensification eject, or increasing impact of son preference at lower parities, is manifested in strong son preference stores experiencing large fertility declines such as Punjab and Haryana. Son preference continues to affect fertility at lower priorities and it is possible that a floor well above replacement level is forming. especially in the populous northern/central stores. However, with the increasing incidence of sex-selective abortions it is possible that lower fertility with dramatically skewed sex ratios at birth will result
