Koefisien Gesek Pipa Kasar dengan Biopolimer Guar Gum

Deskripsi Lengkap: https://lib.ui.ac.id/detail?id=20304062&lokasi=lokal

Abstrak

Luminar flow and turbulent of dilute polymer guar gum (fatter) solutions in smooth and in rough pines was studied This experiment use in 25.4 mm of diameter pipe (PVC), which roughened by (k) 0, 34. 0,8 and 1, 59 mm roughness value of sand grain and 250, 500 and 1000 ppm for additive concentration. The results show that flow properties ore influenced by polymer addition and surface roughness. In the transition and turbulent flow regime without additive the increasing of friction coefficient appeared to be effected by wall condition alone. Addition of polymer to water is effective for rough pipe. For example with addition of 1000 ppm of polymer reduced drag in k/D = 0.03 rough pipe by 24 percent at Reynolds number 2 x 10, whereas in 250 ppm addition tested drag was reduced only 5 percent
