Abstrak

Prosedur perawatan luka yang tidak sesuai standar menjadi salah satu penyebab infeksi pascabedah.

Supervisi klinik dapat meningkatkan kualitas praktik keperawatan. Penelitian bertujuan untuk mendapatkan gambaran pengaruh supervisi klinik terhadap kualitas tindakan perawatan luka. Metoda yang digunakan adalah quasi experimental pre-post test with control group. Sampel penelitian (33 kontrol & 33 intervensi) diambil menggunakan teknik accidental (saat pre-test) dan purposive (pada post-test).

Hasil penelitian didapat perbedaan antara kelompok yang diberi pelatihan dan tidak diberi pelatihan ($p=0.001$) dan ditemukan adanya pengaruh supervisi terhadap kualitas tindakan perawatan luka ($r=0.613$, $p=0.001$; $=0.05$). Kepala ruang perlu diberikan pelatihan supervisi agar dapat melakukan kegiatan supervisi dengan baik untuk peningkatan perawatan luka.

.....Un-standardized Wound caring procedure will affect post surgery infection. Clinical Supervision can improve quality of nursing practice. The research purpose to get descriptions of clinical supervision towards to quality of wound caring action. Method used experimental pre-post test with control group. Accidental technique in data taking before and purposive sampling in data taking after training for 33 control and 33 intervention sampel.

The result suggest that there are difference between the trained group and the untrained group ($p=0.001$) and there are a influence of supervision towards quality of wound caring action ($r=0.613$, $p=0.001$, $=0.05$). The head nursing need to be given supervision training in order to be able to supervise well for improving quality of wound care.
