#### <b>ABSTRACT</b><br>

The aim of this study was to identify the characteristics of LBW infant and mother having LBW infant in RSUD Kabupaten Bekasi. It was chosen as it gave effect on mortality as well as morbidity after giving birth. This study used a simple descriptive design with total sampling technique. In got the sample, the researcher took 21 respondents. Moreover, the researcher used questionnaire for getting data. The univariant analysis of the 21 LBW infant giving births showed that the result of characteristics were preterm infant, having low weight when she/he was born, primipara, and twins. Meanwhile, the characteristics of mother having LBW infant were low educated, low social-economic class, contaminated cigarette on her pregnancy, and inadequate nutritions. Based on this study, there are some recommends as follow: 1. Improve the knowledge and the skills of neonate?s nurse, 2. Simplicity recommendation to management having complete facilities, and 3. Referral system must be repaired.
