Abstrak

Perawat sering melakukan kesalahan dalam memberikan cairan intravena. Hal ini dapat diminimalkan dengan supervisi, namun kenyataan yang ada kegiatan supervisi belum optimal dan hanya sebatas pengawasan. Tujuan penelitian ini mengetahui pengaruh supervisi pimpinan ruang terhadap pelaksanaan pemberian cairan intravena. Metode yang digunakan adalah kuantitatif dan kualitatif. Sampel kuantitatif berjumlah 66 responden, partisipan FGD berjumlah 6.

Hasil penelitian ketiga sub variabel supervisi berpengaruh terhadap pemberian cairan intravena. Hasil FGD diidentifikasi 5 tema yaitu pemahaman pimpinan ruang tentang supervisi, mempertahankan kinerja perawat pelaksana, meningkatkan pengetahuan dan keterampilan, pimpinan ruang memberikan dukungan dan dorongan, supervisi yang kurang terstandar. Direkomendasikan untuk meningkatkan kegiatan supervisi secara berjenjang dan membuat suatu perencanaan supervisi yang terstandar.

.....Nurses often make mistakes in administering intravenous fluids. This can be minimized with supervision, but there is a fact that supervision has not been optimized and this activity limited only on one way control. The purpose of this study was to determine the influence of supervision by head nurse on intravenous therapy administration. The method used was quantitative and qualitative methods. Samples in a quantitative approach were 66 respondents, while the number of participants in Focus Group Discussion was 6 head of wards.

The results obtained indicated that the three sub variables affected the administration of intravenous fluids. The results of FGD identified several themes, namely the understanding of head nurses about supervision, maintaining performance, improving knowledge and skills, providing support and encouragement, and supervision that was less standardized. It is recommended that head nurses need to improve supervision activities on an ongoing basis, to make a standardized plan about supervision.
