#### <b>ABSTRACT</b><br>

The development of male hormonal contraception is based on a decrease in sperm concentration without affecting

libido and sexual potency. The combination of depot medroxy progesterone acetate (DMPA) + extract of Javanese long

pepper (JLP) with dosages of 0.94 mg and 1.88 mg decreases

the concentration of spermatozoa. However, it remains

unknown whether the combination influences body weight, hematology, and blood biochemistry. Therefore, it is

necessary to investigate the effect of DMPA + JLP extracts on the body weight, hematology, and blood biochemistry of

male rats (*Rattus norvegicus* L.) using Sprague-Dawley strains. The research uses a completely randomized design (CRD); one group control and two treatment groups. In the first group, the castrated rats were given

oral administration extracts of JLP (CJ) with doses of 0, 0.94, 1.88, 2.82, and 3.76 mg. In the second group, the rats were injected with 1.25mg DMPA and given an oral administration extract of JLP. Injection was

given in week-0 and 12. Administration was conducted every day from week 7-18. Analysis of the normality and homogeneity of data is done before the ANOVA test. Data that is abnormal and not

homogeneous are tested with non-parametric statistical Kruskal-Wallis. This study

shows that the combination of minimal doses of DMPA and administration various doses of extracts of JLP does not

affect body weight and hematology (erythrocyte, hemoglobin, hematocrite), and the blood biochemistry of rats, such as

the values of SGPT, SGOT, HDL, and triglycerides ( $p < 0.05$ ), but rather the total cholesterol and LDL ( $p < 0.05$ ). Furthermore, it is concluded that the combination of the minimal dosage of DMPA and weaned

various dosages of JLP

extracts affect the total value and LDL cholesterol but do not influence body weight, nor hematology and blood biochemistry. Such combinations can be drawn on for a safe male contraceptive model by taking into

account the value of the total cholesterol and LDL during its use.
