Deskripsi Lengkap: <https://lib.ui.ac.id/detail?id=20330985&lokasi=lokal>

Abstrak

Perancah merupakan komponen penting dalam pengerjaan struktur di sektor konstruksi. Pekerja harus memanjat dan berada di ketinggian ketika bekerja pada perancah. Aspek keselamatan dari proses kegiatan perancah harus diperhatikan baik pada tahap pemasangan dan pembongkaran. Proses kegiatan perancah memiliki potensi bahaya seperti terjatuh, terjepit, terpeleset, dan tertimpa main frame. Penelitian ini menggunakan metode deskriptif analisis melalui pendekatan manajemen risiko AS/NZS 4360:2004 untuk mengurangi potensi bahaya. Pengerjaan perancah perlu adanya SOP, perizinan bekerja di ketinggian, pengawasan, penggunaan APD, dan komunikasi antarsesama pekerja perancah.

<hr><i>Scaffolding is one of important component in construction. Workers have to climb and stand on above scaffolding. Safety aspects of the activities scaffold must be considered both at the stage of setting up and dismantling. The process of scaffolding activities have potential hazards such as falls, pinched, slip, and hit the main frame. This research use descriptive analysis through risk management approach AS / NZS 4360:2004 to reduce potential hazards. Work on scaffold need SOP, height permit to work, supervision, uses PPE, and the communication between scaffold worker.</i>
