Abstrak

Indonesia is a centre of global marine bio-resources, particularly on its coral reefs ecosystem. Besides its physical function, coral reefs also provide an aesthetic function. This beauty of these reefs pioneered the ornamental fish hobbyists to keep the corals and marine fish in their own aquarium tank. Marine ornamental fish trade from Indonesia to the world had started around the early of '80s and still continues to improve until today. Sustainable utilization plan in order to reduce the exploitation pressure on the reefs, particularly for aquarium industry, is done through coral captivity or known as coral culture. However, since the commencement of this activity there has been no research yet which can explain on the gap between the action regulation on coral culture for the aquarium industry and its implementation in fields.
