Abstrak

Angka kejadian kanker stadium III dan IV pada usia dewasa semakin meningkat tiap tahunnya. Penelitian ini bertujuan untuk mengetahui hubungan dukungan keluarga terhadap kualitas hidup anggota keluarganya yang menderita kanker stadium III dan IV di RSKD. Desain penelitian yang digunakan deskriptif korelatif dengan metode analisis univariat dan bivariat. Jumlah sampel 79 responden.

Hasil penelitian didapatkan tidak ada hubungan signifikan antara dukungan keluarga terhadap kualitas hidup klien kanker stadium III dan IV. Perawat dalam menghadapi klien sebaiknya menggali koping adaptif, aspek positif, dan aspek spiritualitas klien tidak hanya memberikan dukungan psikologis dalam upaya peningkatan kualitas hidup klien itu sendiri.

.....The incidence of stage III and stage IV cancer adulthood is increasing every year. This study aims to determine the relationship of the family support to quality of life of family members who have stage III and/or stage IV cancer RSKD. The design study is descriptive correlative with univariate and bivariate analysis methods. The number of respondents are 79.

The results showed no significant relationship between family support and the quality of life of clients who have stage III and IV cancer. In dealing with clients, nurses should explore adaptive coping, positive, and spiritual aspects of the client, not only provide psychological support in order to improving quality of life of the client itself.
