Abstrak

Praktek Kerja Profesi Apoteker di Direktorat Jenderal Bina Kefarmasian dan Alat Kesehatan bertujuan untuk memahami tugas pokok dan fungsi dari Direktorat Jenderal Bina Kefarmasian dan Alat Kesehatan dan Direktorat Bina Obat Publik dan Perbekalan Kesehatan serta peran apoteker di Direktorat Bina Obat Publik dan Perbekalan Kesehatan. Tugas khusus yang berjudul Kajian Perencanaan Obat Program Perbaikan Gizi Masyarakat di Kabupaten/Kota bertujuan untuk mengkaji proses perencanaan obat program perbaikan gizi di Kabupaten/Kota. Berdasarkan hasil kajian, kegiatan perencanaan obat perbaikan gizi sudah sesuai dengan buku acuan *The Logistic Handbook: A Practical Guide for the Supply Chain Management of Health Commodities* dan *A Practical Guide For Procurement Planning And Management Of Strategic Public Health Supplies* terutama dalam proses seleksi obat dan perhitungan (kuantifikasi) secara umum. Namun, pada proses perhitungan, khususnya pada tahap perkiraan spesifik pemakaian obat perbaikan gizi, masih belum sesuai karena informasi mengenai populasi grup (ibu hamil dan balita) yang mendapatkan suplemen gizi belum tercantum dalam buku *Pedoman Pengelolaan Obat Program Perbaikan Gizi Masyarakat*. Selain itu, pada buku pedoman tersebut belum tercantum perhitungan kebutuhan obat program perbaikan gizi yaitu vitamin A yang juga diperlukan pada kasus tertentu seperti campak, diare, xerophthalmia, pneumonia dan kejadian bencana alam.

*Pharmacist Internship Program at the Directorate General of Pharmaceutical and Medical Devices aimed to understand the duties and functions of the Directorate General of Pharmaceutical and Medical Devices and the Directorate of Public Drugs and Health Supplies and also the role of pharmacists at the Directorate of Public Drugs and Health Supplies. A special assignment was entitled Assessment of Community Nutrition Improvement Program Drug Planning at District/City aimed to assess on nutrition improvement program drug planning process at district/city. Based on the results of the study, nutrition improvement program drug planning activities was appropriate with the references book *The Logistic Handbook: A Practical Guide for the Supply Chain Management of Health Commodities* and *A Practical Guide for Procurement Planning and Management Of Strategic Public Health Supplies* especially in the general drug selection and calculation (quantification) process. However, in the calculation process, especially on the specific estimation of nutrition improvement drugs consumption, was still not appropriate yet because the information about the group populations (pregnant women and children under five) who received nutritional supplements were still not listed in the *Community Nutrition Improvement Program Drug Planning Management Guideline*. In addition, on that guideline book hasn't yet included calculation of required nutrition improvement program drug vitamin A which is also required in some cases such as measles, diarrhea, xerophthalmia, pneumonia and the occurrence of natural disasters.*
