Abstrak

[ABSTRAK

Penelitian ini bertujuan untuk mengembangkan skala kerawanan berfantasi baru yang valid dan reliable secara psikometris. Skala ini dibangun oleh sekelompok peneliti dan telah melalui studi pilot yang menghasilkan 10 item akhir untuk mengukur kerawanan berfantasi. Penelitian ini dilakukan dengan partisipasi mahasiswa dari University of Queensland yang terdaftar dalam mata kuliah PSYC3020 Measurement in psychology. Studi ini menemukan bahwa skala kerawanan berfantasi yang baru dikembangkan ini berkorelasi positif dengan kreativitas dan skala CEQ. Tidak ada perbedaan signifikan yang ditemukan antara nilai peserta laki-laki dan perempuan. Skala baru memiliki konsistensi internal yang baik (76 menunjukkan reliabilitas yang baik) dan indeks diskriminasi soal yang memadai (mulai dari 20 sebagai yang terendah dan 57 sebagai yang tertinggi). Hasil dari penelitian ini sesuai dengan hipotesis pertama dan kedua di mana skor peserta berkorelasi positif dengan kreativitas dan skala CEQ, namun tidak sesuai dengan hipotesis ketiga. Skala baru ini bisa digunakan dalam merekrut individu untuk bekerja di bidang yang membutuhkan tingkat tinggi fantasi, wilayah rawan seperti arsitektur atau industri film.

ABSTRACT

The study aims to develop a new fantasy proneness scale that is psychometrically valid and reliable by developing a new scale. The scale was constructed by a group of researchers and has undergone a pilot study resulting in 10 final items to measure fantasy proneness. The study was conducted with the participation of students from University of Queensland who enrolled in the PSYC3020 course. The study finds that the new fantasy proneness scale was positively correlated with the creativity and CEQ scale. No significant difference was found between the scores of males and females participants. The new scale possesses a good amount of internal consistency (76 indicating good reliability) and an adequate item discrimination indices ranging from 20 as the lowest and 57 as the highest. The results of the study were similar to the first and second hypotheses where participants' score correlated positively with creativity and CEQ scale, however, the third hypothesis was not supported. The new scale could be used in recruiting individuals to work in fields that require a high level of fantasy proneness, such as architecture or movie industry. The study aims to develop a new fantasy proneness scale that is psychometrically valid and reliable by developing a new scale.
