Abstrak

ABSTRAK

Bedah paru merupakan layanan unggulan RSUP Persahabatan. Metode pembayaran memiliki efek yang berbeda terhadap kendali kualitas dan kendali biaya.

Belum diketahuinya perbandingan kendali kualitas dan kendali biaya pada pasien rawat inap dengan tindakan bedah paru maka perlu dilakukan perbandingan tiga jenis metode pembayaran yaitu Paket dan Fee For Service, Fee For Service, dan INA-CBG's terhadap kendali kualitas meliputi utilisasi pelayanan dan jumlah visit dokter, serta kendali biaya meliputi besaran pembayaran dan lama hari rawat.

Dilakukan penelitian kuantitatif dengan metode survey untuk mengetahui utilisasi pelayanan, jumlah visit dokter, besaran pembayaran, dan lama hari rawat dari data sekunder berupa catatan rekam medic, billing, dan luaran SIM RS.

Untuk menjelaskan hasil yang diperoleh pada penelitian kuantitatif, dilakukan penelitian kualitatif dengan desain deskriptif evaluative terhadap penentu kebijakan; koordinator dan pemantau profesi; pusat pencatatan, pelaporan, dan pengklaiman; dan pemberi pelayanan.

Diperoleh hasil terdapat item Laboratorium, Radiodiagnostik, Elektromedik, Paru, Konsultasi dan Rehabilitasi Medik, Akomodasi, Tindakan, Labu Darah, dan obat-obatan yang rata-rata pemeriksaan atau penggunaannya sama dan ada yang berbeda diantara ketiga metode pembayaran. Untuk jumlah visit dokter, tidak terdapat perbedaan akan tetapi terdapat perbedaan untuk besaran pembayaran dan lama hari rawat diantara ketiga metode pembayaran.

Diperoleh kesimpulan bahwa belum dapat disimpulkan perbandingan antara metode pembayaran Paket dan Fee For Service, metode pembayaran Fee For Service, dan metode pembayaran INA-CBG's dalam hal kendali kualitas dan kendali biaya karena adanya keterbatasan variabel selama penelitian untuk mencapai perbandingan apple to apple dari ketiga metode pembayaran tersebut.

ABSTRACT

Pulmonary Surgery is the main service in RSUP Persahabatan. The Payment methods has different effect on quality control and cost control. The comparison of quality control and cost control on inpatient with

pulmonary surgery is unknown yet. Three types of payment methods i.e package and fee for service, fee for service, and INA-CBG's will be compared against quality control includes services utilization and number of physician visits, as well as cost control for cost payment, and length of stay.

Quantitative research is conducted by survey methods to find out services utilization, number of physician visits, cost payment, and length of stay from secondary data of medical record, billing, and data SIM RS. To explain the results in quantitative research, qualitative research conducted by evaluative descriptive design against policy, coordinators and profession supervisor; logging centre, reporting, and claim; and physician service.

The obtained result such as laboratory, Radio diagnostic, electro medic, pulmonary, consultation and medical rehabilitation, accommodation, medical treatment, blood SAC, and medicine, has equal average on examination or utilization with minor differentiation between the three method. There are no difference for physicians visit but there are some difference for cost payment and length of stay between the three types of the payment method.

As for conclusion, it could not be inferred comparison between package and fee for service, fee for service, and INA-CBG's payment method in terms of quality control and cost control due to the limitation of the variables during the research to reach apple to apple comparison of three types of payment method.
