Deskripsi Lengkap: <https://lib.ui.ac.id/detail?id=20365269&lokasi=lokal>

Abstrak

Menurut standar nasional, pelayanan obstetri harus mampu melakukan tindakan bedah sesar emergensi dalam waktu 30 menit dari keputusan dibuat (response time). Evaluasi pada tahun 2012, RSUP dr Kariadi tidak dapat memenuhi standar tersebut. Penelitian ini bertujuan untuk mengetahui angka response tim bedah sesar emergensi dan faktor-faktor yang menyebabkan tidak tercapainya standar tersebut. Dilakukan penelitian kuantitatif untuk mencari angka response tim disertai wawancara untuk mengetahui faktor-faktor apa yang mempengaruhi response time tersebut. Sebanyak 207 operasi bedah sesar emergensi dilakukan evaluasi. Didapatkan angka response time 54 menit. Tidak tercapainya standar nasional response tim berkaitan dengan belum adanya standar prosedur operasional tentang persiapan operasi bedah sesar emergensi. Sehingga disarankan untuk segera dibuat standar prosedur operasional yang melibatkan tim multidisiplin.

.....

According to national standards, obstetric services must be able to perform emergency cesarean section within 30 minutes of the decision made (response time). Evaluation in 2012, Doctor Kariadi General Hospital was unable to meet this standards. This study aims to determine the response time of emergency cesarean section and the factors that lead to failure to achieve this standards. Quantitative research conducted to find the response time and interview to determine what factors affect the response time. A total of 207 emergency cesarean section evaluated during the study. The mean response time was 54 minutes. Failure to achieve the national standard response time is related to the lack of standard operating procedures on the preparation of emergency cesarean section. So it is advisable to immediately create a standard operating procedure that involves a multidisciplinary team.
