Abstrak

Metal Matrix Composite (MMC) dengan matriks aluminium memiliki potensi yang tinggi untuk aplikasi balistik karena kombinasi kekuatan dan ketangguhan yang bagus serta massanya yang ringan. Penelitian ini bertujuan untuk mengetahui pengaruh penambahan ZrO₂ sebanyak 5; 7,5 dan 10 vol. % terhadap karakteristik paduan Al-12Zn-5Mg-1Cu-1Si hasil Squeeze Casting. Semakin banyak ZrO₂ yang ditambahkan, kekerasan dan harga impak komposit semakin turun karena ZrO₂ menginisiasi terjadinya pori. Adanya porositas membuat komposit dengan penguat ZrO₂ belum mampu menahan peluru berkaliber 7,62 mm (Tipe III).

<hr>

Metal Matrix Composite (MMC) with aluminium as matrix has high potency for ballistic application that provided good combination of strength and toughness with low density. The purpose of this research is to know the effect of ZrO₂ addition as volume fraction 5, 7.5 and 10 on squeeze-cast Al-12Zn-5Mg-1Cu-1Si alloy characteristic. As ZrO₂ content was increased, the hardness and impact values reduced. This is due to that addition of ZrO₂ leads to formation of void so when ZrO₂ content was increased, void content was increased too. Composites with ZrO₂ as reinforcement were not effective to withstand ballistic impact load of 7,62 mm calibre projectile due to its void content.
