Abstrak

[<b>ABSTRAK</b>

Studi ini memiliki hipotesis bahwa kematangan karir memiliki korelasi yang positif dan signifikan dengan keterlibatan ayah pada remaja. Untuk keperluan penelitian ini, peneliti telah melakukan studinya terhadap 248 responden di Jakarta. Alat ukur Career Development Inventory (CDI) digunakan untuk mengukur kematangan karir dan alat ukur Father Involvement Scale - Reported (FIS-R) untuk keterlibatan ayah. Melalui teknik statistik Pearson Correlation, ditemukan bahwa kematangan karir berkorelasi secara positif dan signifikan dengan keterlibatan ayah. Berdasarkan hasil dari studi ini, peneliti menyarankan agar para ayah di Indonesia dapat lebih terlibat lagi dalam pengembangan karir remaja.

<i><b>ABSTRACT</b>

, This study hypothesized that career maturity correlates positively and significantly with father involvement. There are 248 adolescents in Jakarta involved in this study. Career maturity is measured with Career Development Inventory (CDI). On the other hand, father involvement is measured with Father Involvement Scale – Reported. The Pearson Correlation indicates that career maturity correlates positively and significantly with father involvement. Therefore, it is suggested that fathers in Indonesia should be more involved in their adolescents’ development, especially in their career development so that they can have career maturity.]
