Abstrak

ABSTRAK

Latar Belakang : penggunaan trauma skor dapat menentukan penanganan pasien trauma dengan cepat dan tepat sehingga menurunkan mortalitas hingga 25%. Tujuan : untuk mengetahui perbandingan performa skoring GAP dengan TRISS dalam memprediksi mortalitas pasien trauma IGD RSCM Januari-Desember 2013. Desain Penelitian : studi cross sectional dengan sampel Rekam Medik pasien trauma IGD RSCM. Hasil penelitian : skor GAP memiliki nilai sensitifitas 80% dan spesifitas 98,8% Kesimpulan : skor GAP sangat baik untuk prediksi pasien trauma yang hidup tetapi kurang baik untuk menentukan prediksi mortalitas pasien trauma di IGD RSCM

ABSTRACT

Title: The comparison of performance between GAP and TRISS Scoring in the prediction of mortality of trauma patients in the Emergency Room of RSCM from January until December 2013

Background: The use of trauma scoring can speed up the handling of trauma patients in order to reduce mortality of patients by up to 25%

Objective: to know how the result of the performance between GAP and TRISS scoring in the prediction of mortality of trauma patients.

Study design: cross sectional study which the sample was taken from Medical Records. of trauma patiens for 1 year. Result: showed that the sensitivity GAP value of 80% and 99,8% for specificity. Conclusion: the GAP is very goog for determining the prediction of life but not good enough for the prediction of mortality of trauma patients in emergency room of RSCM.
