Abstrak

[**ABSTRAK**]

Studi ini bertujuan untuk mempelajari pengaruh keterlibatan suami terhadap pemanfaatan penolong persalinan tenaga kesehatan menggunakan data 6.425 wanita usia subur berusia 15-49 tahun yang menikah/hidup bersama dan mempunyai anak yang lahir terakhir dalam masa survei SDKI 2012. Hasil regresi logistik biner menunjukkan bahwa keterlibatan suami memiliki pengaruh signifikan terhadap pemanfaatan penolong persalinan tenaga kesehatan.

Ditemukan pula bahwa faktor-faktor terkuat yang mempengaruhi pemanfaatan penolong persalinan tenaga kesehatan adalah tempat tinggal, pendidikan suami, dan kehadiran suami saat antenatal care. Salah satu variabel yang menunjukkan akses, yaitu jarak ke fasilitas kesehatan, juga memiliki pengaruh yang signifikan terhadap pemanfaatan penolong persalinan.

ABSTRACT

This study aims to analyze the influence of husband's involvement on skilled birth attendants' (SBA) utilization using the data of 6,425 married/cohabiting women at reproductive age from IDHS 2012. The results of binary logistic regression show that the involvement of husbands have significant influence on the SBA's utilization. It is also found that the strongest factors influencing the utilization of SBA are residence, husband's education, and the presence of husband during antenatal care. One variable that indicates access, which is the distance to health facilities, also has significant influence on the utilization of SBA; This study aims to analyze the influence of husband's involvement on skilled birth
