## Abstrak

[<b>ABSTRAK</b><br>

Tujuan utama masyarakat tinggal dipertanian adalah untuk mencari pekerjaan yang lebih layak untuk memenuhi kebutuhan hidup. Perempuan yang bekerja shift sekaligus menjalani kehamilan, akan berisiko tinggi terhadap kehamilannya. Karya ilmiah ini bertujuan untuk memberikan gambaran asuhan keperawatan kehamilan dengan plasenta previa pada perempuan bekerja shift. Berbagai masalah keperawatan yang ditemukan pada Ny. A selama periode antenatal adalah risiko perdarahan, ansietas, deprivasi tidur, dan kesiapan kemampuan memiliki anak sedangkan selama periode postnatal adalah nyeri, keterlambatan pemulihan pasca bedah, konstipasi serta ketidakefektifan pemberian ASI. Masalah keperawatan selama periode antenatal dapat teratasi seluruhnya dengan memberikan implementasi keperawatan yang sesuai. Sedangkan masalah keperawatan selama periode postnatal belum dapat teratasi seluruhnya selama perawatan di rumah sakit, maka dilanjutkan dengan kunjungan rumah untuk memberikan perawatan langsung dan pendidikan kesehatan. Kontrol kehamilan selama periode antenatal adalah hal yang sangat penting bagi ibu bekerja untuk mengetahui pengaruh lingkungan kerja terhadap kehamilannya.

<b>ABSTRACT</b><br>

The main purpose for the people that living in urban was looking for a better job to make a better life. Women who work shifts at once through pregnancy, will be at high risk of pregnancy. This paper had purposed to provide an overview of nursing care pregnancy with placenta previa in women working shift. Various nursing problems found in Ny. A during the antenatal period is a risk of bleeding, anxiety, sleep deprivation, and readiness for enhanced childbearing process while during the postnatal period is acute pain, delay post-surgical recovery, constipation and ineffective of breastfeeding. Nursing problems during the antenatal period can be resolved entirely by providing appropriate nursing implementations. While nursing problems during the postnatal period can not be fully resolved during hospitalization, then continued with home visits to provide direct care and health education. Control of pregnancy during the antenatal period is very important for working mothers to determine the effect of work environment on pregnancy.. The main purpose for the people that living in urban was looking for a better job to make a better life Women who work shifts at once through pregnancy will be at high risk of pregnancy This paper had purposed to provide an overview of nursing care pregnancy with placenta previa in women working shift Various nursing problems found in Ny A during the antenatal period is a risk of bleeding anxiety sleep deprivation and readiness for enhanced childbearing process while during the postnatal period is acute pain delay post surgical recovery constipation and ineffective of breastfeeding Nursing problems during the antenatal period can be resolved entirely by providing appropriate nursing implementations While nursing
