

Industrial mineral management in research and development institutes

Deskripsi Lengkap: <https://lib.ui.ac.id/detail?id=20407084&lokasi=lokal>

Abstrak

Industrial mineral resources are scattered abundantly throughout Indonesia. However they have not been afforded serious development. As a result, domestic production cannot fulfill the demand for raw materials required by downstream industries. An approach to solve this problem is by providing capital and technical assistance for industries involved in industrial mineral mining. IN this case the R&D are required to provide technical assistance and recommendations to such industries in terms of obtaining capital from the government. Such a management is expected to enhance the development of industrial minerals as well as improve their added value.
