Abstrak

[ABSTRAK

Ibu hamil merupakan salah satu kelompok yang berisiko mengalami anemia yang disebabkan kurangnya zat besi di dalam tubuh dengan berbagai faktor pencetus. Tujuan penelitian mengidentifikasi hubungan dukungan suami dengan kejadian anemia pada ibu hamil. Desain penelitian adalah deskriptif analitik menggunakan pendekatan cross sectional terhadap 60 orang ibu hamil yang diambil dengan teknik purposive sampling. Hasil penelitian menunjukkan hubungan bermakna antara dukungan suami dengan kejadian anemia pada ibu hamil. Bentuk dukungan emosional paling dominan mempengaruhi kejadian anemia pada ibu hamil, dengan p value = 0,021 dan nilai OR 21,592. Rekomendasi penelitian adalah kebijakan melakukan deteksi dini dengan screening Hb, pemberian promosi kesehatan, melakukan asuhan dan pelayanan melibatkan suami, dan meneliti dukungan emosional yang dibutuhkan ibu hamil dengan metode kualitatif.

ABSTRACT

Pregnant women are one of the groups at risk of anemia which was caused by the lack of iron in the body and precipitated by several factors. The aim of research to identify the relationship between their husband's support with the prevalence of anemia in pregnant women. A quantitative descriptive analytic design with cross sectional approach was assigned in this study. Using purposive sampling technique, to 60 pregnant women. The results shows a significant relationship between husband support with the prevalence of anemia in pregnant woman. The emotional support ranked the most powerful support that influence the incidence of anemia in pregnant women, with p value 0,021 and OR 21.592. This study recommends further specific policies which enhance early detection of anemia (Hb screening), the provision of health promotion, care and services which involve husbands, and further qualitative research on emotional support., Pregnant women are one of the groups at risk of anemia which was caused by the lack of iron in the body and precipitated by several factors.
