Abstrak

[**ABSTRAK**]

Ansietas merupakan salah satu masalah kesehatan psikososial yang lebih banyak dialami oleh masyarakat perkotaan. Penulisan Karya Ilmiah Akhir Ners ini bertujuan untuk memberikan analisis praktik keperawatan kesehatan masyarakat perkotaan terkait masalah ansietas pada klien dengan vesikolithiasis. Penulis melakukan asuhan keperawatan psikososial selama enam hari kepada klien yang mengalami ansietas sedang. Vesikolithiasis memunculkan berbagai permasalahan yang turut menjadi salah satu penyebab ansietasnya. Intervensi yang diberikan berupa rangkaian strategi pelaksanaan tindakan keperawatan psikososial ansietas. Evaluasi hasil implementasi menunjukkan bahwa tanda-tanda ansietas pada klien berkurang. Intervensi keperawatan psikososial ansietas perlu dikembangkan dan diimplementasikan di ruang perawatan umum.

ABSTRACT

Anxiety is a form of psychosocial health problem which is experienced more by those living in urban societies. This paper intends to provide an analysis of urban community health nursing practice related to anxiety issues on a client with vesicolithiasis. The author conducted psychosocial nursing care for a period of six days to a client experiencing moderate anxiety. Vesicolithiasis raised various problems, which in turn, became a cause of the ensuing anxiety issues. Intervention provided was in the form of a series nursing action strategies related to the anxiety issues. Evaluation of the implementation results demonstrated that signs of anxiety on client decreased. Psychosocial nursing interventions of anxiety need to be developed and implemented at patient general care wards.; Anxiety is a form of psychosocial health problem which is experienced more by those living in urban societies.
