Abstrak

[**ABSTRAK**] Penulisan Karya Ilmiah ini bertujuan untuk memberikan gambaran dalam pemberian asuhan keperawatan pada anak pasca bedah dengan pemenuhan kebutuhan nutrisi yang terintegrasi dengan teori keperawatan Model Konservasi Levine di Ruang Pediatric Intensive Care Unit. Kelelahan pada pasien disebabkan kurangnya asupan nutrisi sebelum operasi dan kehilangan energi selama proses operasi apabila kondisi tersebut tidak segera diatasi dapat menjadi malnutrisi. Pasien pasca bedah harus segera diberi nutrisi melalui parenteral enteral atau oral. Tindakan Keperawatan berdasarkan ke 4 konservasi yaitu menjaga kepatenannya aliran TPN dan memastikan kebutuhan nutrisi anak terpenuhi untuk mencapai keseimbangan energi. Perawat juga melakukan pendekatan konservasi integritas sosial untuk mendapatkan dukungan dari orang tua. Selama memberikan asuhan keperawatan anak mencapai keseimbangan energi yang diberikan secara parenteral parsial dan oral serta melibatkan keluarga dalam proses perawatan tersebut.

ABSTRACT This Scientific Paper aims to provide an overview of the provision of nursing care in children post surgical by integrated nutritional fulfillment by using Levine Conservation Model nursing theory in Pediatric Intensive Care Unit Room. Fatigue of patients caused of nutritional deficiencies intake pre surgical and loss energy during surgery process when the condition is not immediately resolved can generate malnutrition effect. Patients of post surgical should be given nutrition through parenteral enteral or oral. Nursing treatment based on 4 conservations is to maintain the patency of TPN stream and to ensure the child's nutritional needs is fulfilled to get energy balance. Nurses also undertake conservation of social integrity approach to obtain the parents support. During provide separated parenterally and orally nursing care child achieve energy balance and involve families in the treatment process.
