

Novel apoptotic regulators in carcinogenesis

George G. Chen, editor

Deskripsi Lengkap: <https://lib.ui.ac.id/detail?id=20417304&lokasi=lokal>

Abstrak

Our recent understanding of the cellular and molecular defects and the regulation of the apoptotic signalling pathways has resulted in rationally designed anticancer strategies and the development of novel agents that regulates apoptosis. A comprehensive review of all apoptotic-related anticancer therapies is not the purpose of this book. However, in the volume of this book with 11 chapters, we have described a number of novel apoptotic regulators that have shown promising value and also great feasibility for cancer treatment. These novel agents either occur naturally or are chemically syntheses.
