Abstrak

Mencuci tangan dapat dilalukan oleh anak yaitu sebelum dan sesudah beraktifitas sebagai upaya pencegahan dan pengendalian infeksi di rumah sakit. Penelitian ini bertujuan unhrk mengidentifikasi efektivitas permainan terapeutik: Cuci tangan dengan flannelgrapft kombinasi demonstrasi terhadap ketepatan anak dalam mencuci tangan. Desain pada penelitian ini menggunakan quasi elcsperiment: post test-only non equivalent control group terhadap 96 anak usia 3-12 tahun yang dibagi menjadi kelompok intervensi dan kontrol dengan consecutive sampling. Hasil penelitian menunjulJcan bermain terapeutik: cuci tangan menggunakan flannelgraph kombinasi demonstrasi efektif terhadap ketepatan anak mencuci tangan ($p < 0,001$). Hasil penelitian dapat diaplikasikan sebagai intervensi berrnain terapeutik di rumah sakit.

.....

Hand washing activity can be done by children before and after the children do activities as an effort in the prevention and control of infections in hospitals. This study aims to identiflu the effectiveness of therapeutic play: Handwashing with flannelgraph combination of demonstrations toward the accuracy of children in hand washing . The design of this research uses a quasi experiment: post-test-only non equivalent control group towards 96 aged 3-12 who were divided into the intervention group and the control goup with consecutive sampling. The results showed that the therapeutic play: Handwashing with flannelgraph combination demonstration is effective toward the children accuracy of hand washing ($p < 0.001$). The results of this study can be applied as an interventions of therapeutic play in hospitals.
