Abstrak

Penelitian ini membahas perbandingan angka rujukan berdasarkan karakteristik peserta rujukan RJTP BPJS Kesehatan Kantor Cabang Utama Bogor di Puskesmas Cimandala dan Puskesmas Bojong Gede. Penelitian ini merupakan penelitian kuantitatif dan kualitatif dengan menggunakan data primer dari hasil wawancara mendalam dan data sekunder dari primary care puskesmas.

Hasil penelitian menunjukkan bahwa angka rujukan Puskesmas Cimandala sebesar 27,9% lebih tinggi dari Puskesmas Bojong Gede sebesar 14,9%. Hal ini dipengaruhi oleh ketersediaan fasilitas penunjang pelayanan kesehatan dan ketersediaan obat-obatan di puskesmas dapat mempengaruhi peningkatan pasien untuk dirujuk ke fasilitas kesehatan tingkat lanjutan.

<hr><i>This research discusses the comparative reference number based on the characteristics of the RJTP participants of BPJS Kesehatan Main Branch Office Bogor in Cimandala Health Center and Bojong Gede Health Center. This research written by using quantitative and qualitative method, primary data for this research taken from in-depth interviews and secondary data are based on the primary care of Health Centers data.

The result of this research, shows that the referral number of Cimandala Health Center reached 27,9% higher from Bojong Gede Health Center reach 14,9%. It is the because of the availability of health care support facilities and the availability of medicines in health centers can influence the increase of patients to be referred to the health care in advanced level.</i>
