## Abstrak

Dalam penelitian ini, efek dari Pola hujan terhadap Faktor Keamanan (FK) dianalisis dalam geometri yang berbeda dalam lereng tak jenuh dengan cara studi parametrik. Geometri lereng yang berbeda direpresentasikan dalam sudut:  $30^\circ$ ,  $45^\circ$ , dan  $60^\circ$  dan hujan diasumsikan memiliki tiga pola, yaitu normal, advanced, dan delayed. Analisis rembesan dilakukan dengan SEEP/W dan stabilitas lereng dengan SLOPE/W. FK terkecil didapatkan pada pola hujan advanced pada  $30^\circ$  dan  $45^\circ$ , dan pola hujan delayed pada sudut  $60^\circ$ . Penurunan FK terkecil dialami sudut  $45^\circ$ , diikuti  $60^\circ$ , dan  $30^\circ$  dikarenakan perubahan tegangan air pori negatif dan kenaikan Muka Air Tanah.

<hr><i>In this research, effect of rain intensity to the Safety Factor (FS) will be analysed in different geometries on unsaturated slope by conducting a parametric study. Different geometries are represented by different slope angles:  $30^\circ$ ,  $45^\circ$ , and  $60^\circ$  and the rainfall to have three different pattern, which are normal, advanced, and delayed. Seepage analysis is conducted with SEEP/W and slope stability with SLOPE/W. Lowest FS reached at advanced pattern at  $30^\circ$  and  $45^\circ$ , and delayed pattern at  $60^\circ$ . Least FS reduction observed at  $45^\circ$ , followed by  $60^\circ$ , and  $30^\circ$  due to change of negative PWP and rising GWL.</i>
