Abstrak

Penelitian ini bertujuan untuk mempelajari pengaruh umur kawin pertama serta faktor-faktor demografi, sosial, ekonomi dan karakteristik perkawinan terhadap otonomi perempuan dalam rumah tangga di Indonesia menggunakan data SDKI 2012. Tetapi berdasarkan tinjauan literatur, variabel umur kawin pertama diduga mengalami masalah endogenitas sehingga umur kawin pertama diprediksi terlebih dahulu menggunakan regresi OLS.

Hasil prediksi umur kawin pertama tersebut yang kemudian digunakan dalam model otonomi perempuan. Hasil analisis model otonomi perempuan menggunakan regresi logistik biner, menunjukkan bahwa umur kawin pertama berpengaruh positif terhadap otonomi perempuan dalam keputusan rumah tangga, tetapi berpengaruh negatif terhadap otonomi perempuan dalam keputusan penggunaan KB.

This research aims to study the effect of age at first marriage and demographic, social, economic factors, and characteristics of marriage on women's autonomy of household in Indonesia using the 2012 Indonesia Demographic and Health Survey (IDHS) data. But based on literature review, variable age at first marriage suspected endogeneity so age at first marriage predicted using OLS regression previously.

The result of age at first marriage predicted that used on women's autonomy model. The results of women's autonomy using binary logistic regression, show that age at first marriage have positive effect on women's autonomy in household decision making and negative effect on contraceptive use decision making.
