Abstrak

A factor to pay attention to in orthodontic treatment is the inclination of upper and lower incisors. The inclination could be evaluated from interincisal angle and angle of upper incisor (UI) with cranium base (SN). This research is to evaluate those angles after the retraction of upper and lower incisors on malocclusion class I with bimaxillary protrusion. In total, 34 samples were treated using edgewise system. The results show that mean for UI ? LI is $138.06^{\circ} \pm 1.47^{\circ}$, and for UI ? SN $95.97^{\circ} \pm 1.27^{\circ}$.
