

Penatalaksanaan pulpa nekrosis akibat trauma pada gigi insisivus sentral dengan apeks terbuka

Deskripsi Lengkap: <https://lib.ui.ac.id/detail?id=20437225&lokasi=lokal>

Abstrak

One of the important factors that supported the success of root canal treatment is filling the root canal system hermetically. Necrosis of young permanent teeth poses a difficulty in root canal treatment and induction of the apical area to build an apical stop should be conducted. Apical constriction is necessary to fill the root canal and Calcium Hydroxide is used for this purpose, so that the filling material will not extend beyond the root canal system. A case of successful treatment of a traumatized tooth was reported using Calcium Hydroxide.
