

Reaksi likenoid oral dihubungkan dengan hipersensivitas terhadap tumpatan amalgam (study pustaka)

Deskripsi Lengkap: <https://lib.ui.ac.id/detail?id=20437469&lokasi=lokal>

Abstrak

Until recently the etiology and pathogenesis of oral lichenoid reaction remain unclear. Usually lichenoid reaction is associated with systemic disease or particular drugs such as ACE inhibitor anti hypertension and several dental materials. Amalgam restorations have been reported as most frequent cause of oral lichenoid reaction induced by dental materials. Mercury hypersensitivity is predicted to be responsible in inducing the reaction. The aim of this review was to describe oral lichenoid reaction associated with hypersensitivity to dental amalgam, so the clinician can manage the cases properly. In conclusion, replacement the amalgam filling which contact to the oral mucosa with other inert dental materials would be useful for hypersensitive patient.
