

Displasia kraniofasial akibat gangguan tumbuh kembang menurut patomorfogenik

Deskripsi Lengkap: <https://lib.ui.ac.id/detail?id=20438026&lokasi=lokal>

Abstrak

Craniofacial dysplasias are rarely found, but the frequency of cleft lip and palate in Indonesia is quite high. Accurate observation and identification of this dysplasia should be done before treatment. To recognize the craniofacial dysplasia, a classification is needed. One of the classifications is based on patomorphogenic. This classification will identify the craniofacial dysplasia from stage of development, origin, form and site. The clinicians will manage these patients accurately with this classification and the patient's quality of life will be improved.
