

Replantasi gigi insisif sentral atas pada anak usia 3 1/2 tahun (laporan kasus)

Deskripsi Lengkap: <https://lib.ui.ac.id/detail?id=20438221&lokasi=lokal>

Abstrak

Traumatic usually in children because falls and the treatment is moderate. Frequency of traumatic is 7-13% from all traumatic case in primary dentition. Avulsion is one of its and the treatment is replantation. This treatment needs an accurate examination. The function of primary dentition is for bite, talk and estetics especially for the children in the growth and development stage. In this case the patient is a girl 3 1/2 years old, with incisive central upper jaw avulsion because of falls replantation is the choise treatment, replantation be done 4 hours after falls. The clinical result after 5 month is no luxation, and the radiographic interpretation is good bone healing in incisive central.
