Abstrak

The management of failure case resulting from mummification treatment. Signs of successful treatment following mummification are the absence of clinical complaints, the formation of secondary cement, and no periapical pathosis present. Treatment about amputation of the infected pulp, which has been devitalized in the pulp chamber and leaving the necrotic pulp tissues in root canal is no longer in accordance with treatment tenet now a day. The remaining necrotic tissues are a focus of infection capable of disturbing biologic healing of tissues. Three cases of root canal treatment following pulp mummification which have been done cause complaints from discomfort to severe pain and the infections spread to periapical tissue in 2, 10, and 22 years afterwards. The results of the treatment are good and periapical radiolucency showing signs of diminution and disappearance. Evaluation on each case was done in 3 months, 6 months and 2 years after the root canal treatment.
