Deskripsi Lengkap: <https://lib.ui.ac.id/detail?id=20438360&lokasi=lokal>

Abstrak

Therapy of radiation is chosen therapy for oral cancer especially Carcinoma Nasopharynx, however, often caused changes in normal tissue in the oral cavity. Based on the anamnesis of the patient, they have dry mouth since the disturbance of the function of Parotid salivary gland has causing the saliva amount became lower. This condition can encourage the caries process. From all of the five cases occurred after the radiation between one month until six year the time, extended damage is seen, demineralization with a small cavity and discoloring teeth color into brown.
