

Pertumbuhan awal ayam merawang yang dipelihara bersama ayam broiler

Deskripsi Lengkap: <https://lib.ui.ac.id/detail?id=20440091&lokasi=lokal>

Abstrak

Kampung chickens have a lot of varieties spreading out all over Indonesia, and becoming everybody's favourites, however, it has low productivity. Meanwhile, broiler chickens who have high productivity has certain level of immunity to a disease.

Chickens have a nature of imitation. From this, a research has been developed to increase the productivity of kampung chickens in term of the increase of their body weigh by comparison of M7B3 (kampung chickens 7 and broiler 3), M5B5 (kampung 5 and broiler 5), M3B7 (kampung 3 and broiler 7) and kampung control M10, and broiler control B10. From this mixture, we can see their eating behavior that has on impact upon the kampung chickens' body weight from those that are DOC to those that are 6 weeks.

Infact, this mixture does not make their growth (the increase of their weight) defferent.

However, M3B7 shows good combination and the increase of their weight on the part of kampung chickens on average. This result may be caused by the narrow combination of the mixture. Heig mortality is experienced by the broiler chickens when they attacked by Berak Kapur disease. This proves that Kampung chickens' immunity is better than that of broiler chickens.
