Deskripsi Lengkap: https://lib.ui.ac.id/detail?id=20441832&lokasi=lokal

Abstrak

This article attempts to identify factors affecting participation in payment of irrigation service fees. There are five

variables comprising demographic and economic of land variables were tested to find the variables that influenced the

participation significantly. The five variables tested consisted of age and formal education as demographic variables;

land productivity, land size, and land tenure as the economic of land variables. The results showed that formal education

(demographic variable) had positive relationship and land size (economic of land variable) had negative relationship

with the participation. Positive relationship between formal education and participation in payment of irrigation service

fees meant that the participation increased as farmers' education increased. Meanwhile, negative relationship between

land size and the participation in payment of irrigation service fees showed that the farmers' participation would

increase as the land size owned by farmers decreased. In other words, participation in payment of irrigation service fees

was higher among farmers with small lands rather than that among farmers with large lands.
