Abstrak

Objective: Garcinia xanthochymus extract has been reported to have several pharmacological properties.

This study

was conducted to evaluate cytotoxic and anti-inflammatory activities of G. xanthochymus extracts on cell lines.

Methods: The roots and stem barks of plant were extracted using maceration method with n-hexane, dichloromethane

and methanol, successively. Cytotoxic activity of the extracts was tested against MCF-7 breast adenocarcinoma using

MTT assay. Anti-inflammatory study was evaluated using RAW 264.7 mouse macrophage cells. The nitric oxide

production in LPS-stimulated cells was measured using Griess reagent. Results: The results of cytotoxic and antiinflammatory

study showed that dichloromethane and n-hexane extracts of root and stem bark exhibited cytotoxic activity in dose-dependent manner. Meanwhile, for anti-inflammatory study, all root extracts together with stem bark

dichloromethane and n-hexane extracts reduce NO production in LPS-stimulated cells in dose dependent manner.

Conclusions: This finding indicated that G. xanthochymus extracts might become interesting candidate for treatment of cancer and inflammation.
