ABSTRACT

Radical cystectomy is a standard management for patients with bladder tumor which has penetrated muscles. Bleeding is one of the morbidity associated with the procedure. This study aims to measure mean blood loss during radical cystectomy. This study was a retrospective analytic study, data was collected using medical records from January 2012 to December 2015 At Haji Adam Malik General Hospital Medan. Variables that affected amount of blood loss staging, type of anesthesia used, and urine diversion, there are no significant differences except on amount of blood loss according to urine diversion method used, which were ureterocutaneostomy and neobladder. Blood preparation is needed about 951.5 ml as standard preparation for surgery in radical sistektomi in RSHAM
