ABSTRACT

This is a modern text and reference book on energy economics. It assumes as background only the microeconomic portion of the introductory or first course in economics, and the mathematical requirements can, for the most part, be met by secondary school algebra. The subjects taken up in some detail are oil, gas, coal, electricity, and energy derivatives - i.e. futures, options, and swaps. There are a large number of simple exercises that are intended to build confidence, and an extensive glossary that both students and energy professionals should find useful.
