ABSTRAK

Urban congestion is always occurred in almost large cities in developing countries for instance Bandung (Indonesia). Public transport is usually being suspected as one of the congestion's trouble maker for almost large cities in Indonesia. This is may due to delay and congestion occurred resulting from overlapped routes, under-supply number of vehicles etc which causes low level of service, low journey speed, high travel time etc. All of these may result in decreasing the public transport's effectiveness, efficiency and service as well as increasing the level of traffic congestion.
