**ABSTRAK
**

Kanker dapat menyerang manusia pada semua usia, salah satunya pada anak. Anak dengan kanker menghadapi penyakitnya didamping keluarga. Keluarga memiliki fungsi penting dalam proses penyembuhan anak kanker. Tujuan penelitian ini untuk mengetahui hubungan coping dengan resiliensi keluarga yang merawat anak penderita kanker. Penelitian ini menggunakan desain penelitian cross sectional pada 60 responden dengan teknik total sampling. Alat pengumpulan data menggunakan kuesioner The Brief of Cope untuk coping dan Family Resilience Assessment Scale untuk resiliensi keluarga. Hasil penelitian menunjukkan adanya hubungan bermakna antara coping dengan resiliensi keluarga yang merawat anak penderita kanker $p\text{-value} = 0,00$; $r = 0,443$; $? = 0,005$. Selain itu, problem focused coping dan emotion focused coping masing-masing memiliki hubungan bermakna dengan resiliensi keluarga anak penderita kanker. Akan tetapi, problem focused coping memiliki hubungan yang lebih kuat dengan resiliensi keluarga dibandingkan dengan emotion focused coping. Responden penelitian ini lebih banyak menggunakan problem focused coping dibandingkan emotion focused coping. Untuk menghasilkan keluarga yang resilien, diperlukan pemberian bimbingan dan penguatan coping terhadap keluarga yang merawat anak penderita kanker.
