Deskripsi Lengkap: <https://lib.ui.ac.id/detail?id=20479510&lokasi=lokal>

Abstrak

Designing research activities prior to implementation is important. Design activities include preparation before, while and after study. Preparation before the survey is to prepare administrative, create a map of the sampling location in the held and to prepare equipment to be used in field work. In the field work, noting the position of sampling location, taking samples and making descriptions of the environment around the area of research. Processes in the laboratory including analyzing the samples to obtain data of the grain size (grainsizes), analyze the data content in the sediments (shells of foraminifera and minerals), and create a map bathymetry. After that all of the data can be used to make the scientific paper.
