## Abstrak

### <b>ABSTRAK</b><br>

Kondisi pasca stroke tidak hanya menimbulkan kecacatan fisik tetapi juga psikologis seperti depresi pasca stroke dan isolasi sosial yang dapat menyebabkan penurunan efikasi diri (<em>self-efficacy</em>) dan mempengaruhi kualitas hidup pasien. Penelitian ini bertujuan mengetahui pengaruh intervensi <em>Stroke Self Management Education </em><em> (</em>SSME) berbasis audiovisual terhadap <em>self efficacy</em> dan kualitas hidup pasien pasca stroke. Penelitian quasi eksperimen ini melibatkan 36 responden yang dipilih dengan teknik <em>concecutive sampling</em> yang dibagi menjadi kelompok intervensi (18 responden) dan kelompok kontrol (18 responden). Hasil uji <em>independent t test</em> menunjukkan adanya perbedaan selisih skor <em>self</em> <em>efficacy </em>(p<em>value</em> < 0.0001;  $\bar{x} \pm 0,05$ ) dan kualitas hidup (p<em>value</em> = 0,001;  $\bar{x} \pm 0,05$ ) yang bermakna antara kelompok intervensi dan kontrol. SSME berbasis audiovisual berpengaruh terhadap <em>self</em> <em>efficacy</em> dan kualitas hidup pada pasien pasca Stroke. SSME ini dapat digunakan untuk meningkatkan <em>self</em> <em>efficacy</em> dan kualitas hidup pada pasien pasca Stroke.</p><p style="text-align: justify;"> </p><hr /><p><em>Post-stroke condition</em><em> can lead to depression and social isolation that significantly decrease self efficacy and quality of life among stroke patient.</em><em> This study aimed at identify</em><em>ing</em><em> the effect</em><em>s</em><em> of Audiovisual-based Stroke Self Management Education (SSME) on self efficacy and quality of life of post-stroke patients. </em><em>The method applied is</em><em> quasi-experimental with total of 36 respondents</em><em>. C</em><em>onsecutive sampling techniques </em><em>was implemented when choosing the research subject </em><em>and divided into two groups</em><em> (intervention group and control group).</em><em> The results of independent t</em><em>-</em><em>test showed</em> <em>there is significant </em><em>mean </em><em>differences </em><em>of</em><em> self efficacy (p value <0.0001;  $\bar{x} \pm 0.05$ ) and quality of life scores</em><em>(</em><em>p value = 0.001;  $\bar{x} \pm 0.05$ )</em> <em>between the intervention and control groups</em><em>.</em> <em>To conclude, </em><em>Audiovisual-based SSME</em><em> a</em><em>ffect</em><em> significantly</em> <em>on </em><em>self efficacy and quality of life among post-stroke patients. </em><em>Audiovisual based </em><em>SSME is recommended to improve self efficacy and quality of life among post-stroke patients.</em></p></p>
