ABSTRAK

One of the genera that can be found in Bogor Botanical Gardens plant collection is Ficus (Moraceae). This genus has several habitus, one of which is hemiepiphyte. There are several stages of hemiepiphyte Ficus spp. growth process. It starts from the epiphytic phase to the last phase as a strangler that can kill the host tree. Hemiepiphyte Ficus spp. has a very important role in terms of improving gardens ecological function. However, hemiepiphyte Ficus spp. need to be properly managed in order not to destroy the host plant especially when it is a plant collection with particular value.
