ABSTRAK

Red angle tampoi or scientific name *Baccaurea angulata* Merr. (Phyllantaceae) is an endemic plant of Borneo island. The other potential is not only as an exotic fruit but also contains antocyanin and antioxidant compounds which are high. The results also reveal the potential of red angle tampoi as a source of natural ingredients for the treatment of cancer and also has antimicrobial activity. Their close relatives besides menteng (*Baccaurea racemosa*) and tampoi (*B. macrocarpa*) also have *B. dulcis* (kupa), *B. motleyana* (rambai). The types of plants are generally dioceous so sometimes there should be a tree with its own male flowers and also there is a tree that flowering female itself. Grown in lowland (less than 800 meters above sea level) also in riparian areas of river or close to swamp areas. Propagation is most easily by seeds, cuttings and graft. Experiments with cuttings can grow leaves up to 3 months in the hood as well as graft within 3 months.
