ABSTRAK

A cross sectional study on nutritional status of children from small scale farmers' household applying different cropping pattern, was carried out in Cianjur District, West Java Province, Indonesia. There were 47 households producing vegetable (VPH) and 44 households producing rice (RPH), which were selected. Children from small-scale farmers' households seem to be quite vulnerable of malnutrition. Comparison of these two groups of small-scale farmers showed that stunting prevalence among children belonging to rice farmers' households was greater than children belonging to vegetable farmers. Dietary of nutrient intake was less in children from rice group than children from vegetable group. Monthly expenditure per capita from rice farmers' households was less than vegetable farmers' households had.
