Abstrak

Latar Belakang: Bencana letusan gunung berapi berdampak pada fisik, psikologis dan sosial budaya.

Tujuan: Menganalisis efektivitas model intervensi keperawatan jiwa untuk membangun ketangguhan

keluarga dalam mengatasi trauma pasca letusan gunung berapi. Metode: Operational research dengan desain

quasy experimental pre-posttest with control group design. Penelitian dilakukan di Kabupaten Magelang

pada bulan Mei-Juni 2023, terhadap 9 perawat, 40 kader kesehatan jiwa dan 82 keluarga, dipilih secara

purposive, menggunakan instrumen Post Traumatic Growth Inventory. Analisis statistik meliputi univariat,

bivariat dengan uji independent t-test, dependent t test, chi square, dan General Linear Model Repeated

Measure. Hasil: tahap 1 didapatkan 5 tema yaitu respons emosional, kebutuhan perlindungan bagi kelompok

rentan, kebutuhan dukungan terkait sumber penghasilan yang hilang, kebutuhan konseling untuk trauma,

dan rasa nyaman membantu. Tahap 2 model, modul dan buku kerja hasil dari konsultasi pakar, dan tahap 3

didapatkan model intervensi keperawatan jiwa untuk meningkatkan ketangguhan keluarga dalam mengatasi

trauma pasca bencana letusan gunung berapi efektif menurunkan trauma pada keluarga. Simpulan: Model

intervensi keperawatan jiwa untuk meningkatkan ketangguhan keluarga dalam mengatasi trauma pasca

bencana letusan gunung berapi efektif menurunkan trauma pada keluarga. Saran: Model ini dapat diterapkan

untuk meningkatkan kapasitas perawat puskesmas, kader kesehatan dan keluarga dalam penanganan trauma

pasca bencana pada keluarga.

.....Background: Volcanic eruption disasters have physical, psychological and socio-cultural impacts.

Objective: Analyze the effectiveness of the psychiatric nursing intervention model to build family resilience

in overcoming trauma after volcanic eruptions. Method: Operational research with a quasi experimental pre-

posttest design with control group design. The research was conducted in Magelang Regency in May-June

2023, on 9 nurses, 40 mental health cadres and 82 families, selected purposively, using the Post Traumatic

Growth Inventory instrument. Statistical analysis includes univariate, bivariate with independent t-test,

dependent t test, chi square, and General Linear Model Repeated Measure. Results: stage 1 found 5 themes,

namely emotional responses, protection needs for vulnerable groups, support needs related to lost sources of

income, need for counseling for trauma, and comfort in helping. Stage 2 models, modules and workbooks

are the results of expert consultations, and stage 3 provides a mental nursing intervention model to increase

family resilience in dealing with post-volcanic eruption disaster trauma that is effective in reducing trauma

in families. Conclusion: The mental nursing intervention model to increase family resilience in dealing with

post-volcanic eruption trauma is effective in reducing family trauma. Suggestion: This model can be applied

to increase the capacity of community health center nurses, health cadres and families in handling post-

disaster trauma in families.
